# Alternative 1: use block mapping

# Alternative 1: use block mapping

**FAST: A log buffer-based  
flash translation layer using  
fully-associative sector  
translation**  
TECS 2007.

SSD

**Store updates  
in log blocks**

# log blocks use page mapping. There are few of them

**When log block  
fills up, merge**

**When log block  
fills up, merge**

**When log block  
fills up, merge**

**When log block  
fills up, merge**

SSD

**When log block  
fills up, merge**

**When log block  
fills up, merge**

**Downsides?**

Downsides?  
**Coupling between  
mapping table and GC.**

## Downsides?

Coupling between  
mapping table and GC.

**One log block can  
have updates from  
different data blocks,  
leading to long GC  
process that rewrites  
many blocks**

Downsides?

Coupling between  
mapping table and GC.

**Sequential writes**

**Random writes**

# Better ideas? :)

Downsides?

Coupling between mapping table and GC.

Sequential writes

Random writes

## Alternative 2: Store Page Mapping in Flash & Cache Parts

# DFTL: a flash translation layer employing demand-based selective caching of page-level address mappings

[illegible]

# SSD

**SSD**

**Stored in flash**

**Flash  
chip**

**SSD**

Flash  
chip

**Buffer pool**  
frequently accessed mapping pages  
(LRU/Clock)

Flash  
chip

**Downsides?**

Buffer pool  
(LRU/Clock)

Flash  
chip

**Downsides?**

**(1) read costs 2 I/Os if  
mapping page isn't cached**

Buffer pool  
(LRU/Clock)

Flash  
chip

**Downsides?**

**(1) read costs 2 I/Os if mapping page isn't cached**

**(2) writes may cost more due to buffer pool evictions**

Buffer pool  
(LRU/Clock)

Flash  
chip

Downsides?

(1) read costs 2 I/Os if mapping page isn't cached

(2) writes may cost more due to buffer pool evictions

**Sequential writes**

**Random I/Os**
